

1. Cover sheet

Project title: A database of hawk migration monitoring sites for the northeast region

Reporting period: March-December 2008

Report date: 9 December 2008

Contact information of PI: Ernesto Ruelas Inzunza
Raptor Population Index Project Manager

Hawk Migration Association of North America
61 Terrace St., Keene NH 03431
or
P.O. Box 721
Plymouth NH 03264

Phone: 607-342-4971
E-mail: ruelas@hmana.org

2. Executive summary

In the spring of 2008, the Northeastern Coordinated Bird Monitoring Partnership granted \$3,000 dollars to the Hawk Migration Association of North America (HMANA) to further develop and populate the raptor migration monitoring site database of HawkCount.org (HMANA's system to collect, archive, visualize, and distribute raptor migration count data).

The objectives of the grant were to corroborate, update, and enhance the descriptions of migration monitoring sites located in the states of the USFWS region 5. Due to a smaller amount granted for this project than the one originally requested, HMANA committed the development of 100 site profiles instead of the 120-150 originally proposed in the grant application.

The sites whose records are now included in HawkCount.org are listed in Appendix 1 (as of 1 December 2008). These records (n=135) are developed to different extents, and can be grouped in three different categories according on the depth of the contents of each description. One important deliverable proposed, the possibility of sharing these site records with the Avian Knowledge Network (AKN), was only partially fulfilled, as AKN does not contemplate storing all the fields in HawkCount.org's site database.

The value of site-specific information in raptor migration monitoring sites is higher than the one collected in many other bird monitoring programs, since the locations for data collection are fixed and many of them are visited regularly by bird watchers. Field sites are one (perhaps the most important) point of access for migration count data.

The depth of the information in each site description depends heavily on the collaboration of the site coordinator. We made all efforts to corroborate the information provided by them, and to collect some of the information by ourselves (e.g. photographic documentation, geo-references, updated contact information, etc.)

Some future important developments for this database are the ability to report site-specific population trend data and visualizations of migration timing.

3. Introduction

Main topic: Data from bird migration monitoring sites (banding stations, migration count sites, acoustic monitoring stations, etc.) have the potential to supplement that of other monitoring programs and, in some cases, they provide the only information available for species underrepresented in these surveys.

This is the case of vultures, hawks, and falcons, whose populations are studied in hundreds of locations across the continent. The directory *Raptor Watch* (Zalles and Bildstein 2000) estimated that nearly 1,800 raptor migration monitoring sites have or have had some kind of field coverage in recent years.

An unknown number of them continue collecting long-term monitoring data. The *Raptor Watch* directory had the goal of profiling the most representative at a global scale, rather than being an exhaustive catalogue, and the number of sites included in the United States chapter is only 112 (Zalles and Bildstein 2000:323).

Specific problem: To this date, however, there is no comprehensive inventory of raptor migration monitoring sites. Why is it important to have a complete directory? Because localities are the point of access to species' count data, as shown by several raptor population trend analyses made in recent years (Bednarz et al. 1989, Hoffman and Smith 2003, Bildstein et al. 2008). Besides its application as a research and monitoring resource, this directory can be of use in planning the development of wind-power projects, since site data can provide specific information on the importance of migration flyways and may be of use to identify areas of possible conflict.

What led to this project's initiation: These records require to be frequently updated, as many fields constantly change when site coordinators shift roles, their addresses change, or their inventory of stored data is updated. The value of this database is increased if it is periodically maintained.

4. Objectives

This project continued the development of an online database of raptor migration monitoring sites, and updated, populated, reviewed, and validated the information of many locations contained in this database. Specifically, we:

- (1) Advanced the format of the database for raptor migration monitoring sites in NE states
- (2) Made data searches to populate/correct/update the database
- (3) Obtained input from site compilers to review site-records
- (4) Published (online and in one case, in print) records of the database. These records can be visualized and exported by users

5. Description of project sites (provide maps where possible)

The records in HawkCount.org's site database (for a list of fields included in this database, please see Appendix 2) come from 135 states in USFWS Region 5. For a model, fully developed site profile, please see Appendix 2. The inventory of migration count data archived for sites in states of USFWS Region 5 is summarized in Appendix 3. Sites with some information in HawkCount.org as of 1 December 2008 are presented in Table 1 (next page).

Table 1. Raptor migration monitoring sites in states of USFWS Region 5 with profiles in HawkCount.org.

CT	28	http://www.hawkcount.org/sitesel.php?country=USA&stateprov=Connecticut

6. Methodology

Site profiles are populated using the template in Appendix 4. Information comes from published sources, as well as data provided by site contacts, information from the internet, gray literature, and other sources. When a record is updated, the site compiler is contacted to review the content. A site record has 108 fields, 6 of them able to exchange information with Cornell Lab of Ornithology databases. Other HawkCount.org data pertaining monitoring sites is stored

in Cornell's AKN (HawkCount.org is one of the top contributors) when data is harvested from HawkCount.org two times a year. A detailed methodology description is available in this grant's project proposal.

7. Results and progress

Updating and reviewing site profiles is an ongoing process and HMANA will continue to make all efforts to keep its site database as current as possible. As stated above, sites are the point of access to monitoring data, and various papers and reports regarding migration monitoring sites have been published by HMANA personnel within the last year using data contained in site profiles (please see Ruelas 2008a, 2008b, Appendix 5 and Appendix 6 [RPI annual report, see ABC as "Golden Eagle" sponsor]).

Targets attained: As of this date, the site profiles with information in HawkCount.org for states in USFWS Region 5 (n=135), are developed to different extents (Appendix 1): "Fully developed" (n=22), 'Partially complete" (n=53), and "Georeferenced placeholder" (n=56) (Table 1).

Targets not attained: The original goal of 120-150 sites was adjusted from the original proposal to 100 due to budget limitations. Communications with site coordinators is key to populate and update site records, and responsiveness from site coordinators prevented the completion of more "Fully developed" profiles.

Actions taken to overcome constraints and obstacles: Increased communication with monitoring sites, frequent updates of contact information.

Prospects for accomplishment of the project's objectives: Objectives completed as stated above.

8. Implications for further work

Lessons learned and an assessment of methods learned: The task of keeping site profiles updated is more labor intensive than originally estimated. Responsiveness of site contacts may limit the accuracy and depth of content in site profiles, and the shortfall filled with paid staff time. Access to data from sources such as the internet and gray literature is important in developing site profiles. Site visits are required in many cases to complete the information of profiles and to collect photographic material.

9. Planned targets and activities for next reporting period

This is a final report, there are no other reports due.

10. Other comments

As of this date, HawkCount.org database manager is developing other site-specific tools, such as reports of population trends online:

<http://rpi-project.org/rpigraph.php>

And also developing a tool to generate seasonal timing graphs per site using data stored (see two examples below):

<http://hawkcount.org/siteinfo.php?rsite=109>
<http://hawkcount.org/siteinfo.php?rsite=100>

These two types of visualizations are also site-specific and expected to be completed during 2009.

11. Appendices

- Appendix 1. Inventory of USFWS Region 5 site profiles (Excel file)
- Appendix 2. Model site profile (PDF)
- Appendix 3. Inventory of data archived in HawkCount.org for USFWS Region 5 (Excel file)
- Appendix 4. Site database template (Excel)
- Appendix 5. ENN Press release (PDF)
- Appendix 6. RPI 2008 annual report (PDF)
- Two articles cited in the “Literature Cited” section

General Site Information

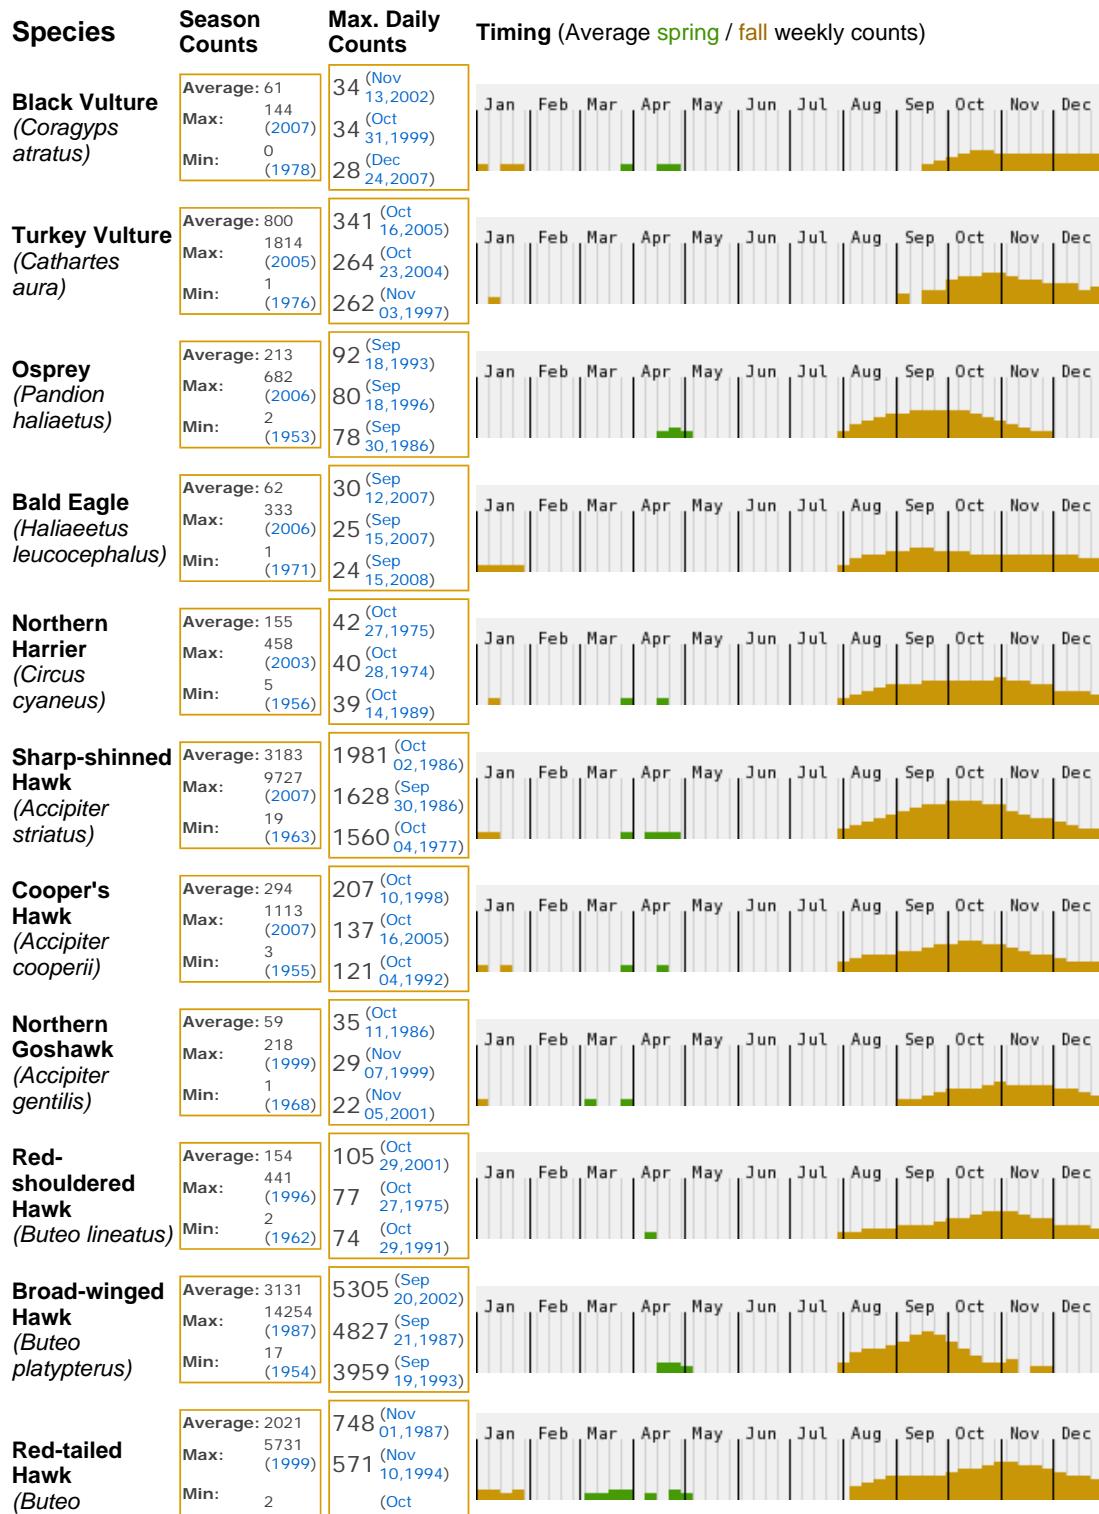

Waggoner's Gap is small gap in the Kittatinny Ridge (also called Blue and North Mountain) where PA Route 74 crosses between Cumberland and Perry Counties. It was named for a family with extensive landholdings at the base of the mountain in Cumberland County, not for its use by wagons. Hawk watching and counting have been done from two sites over the years. The first, at the concrete tower along Route 74, was used as an alternate during inclement weather. The main site sits on the spine of the mountain 75 yards east of the highway. This site is essentially a rock pile with steep descents on both sides. This enables watchers to see both sides of the ridge from one spot. This gives the advantage of being able to see off wind birds easily and increases the wind directions that are productive without requiring a physical move. The ridge runs from the ENE to WSW. The nearest major ridge to the south is South Mountain, roughly 12 miles distant. The nearest major ridge to the north is Tuscarora Mountain, roughly 14 miles away. This expanse on both sides helps limit diffusion of the flight. Trees on both sides of the ridge limit visibility of low flying birds. They also prevent detection of low flying birds coming down the ridge until they are close to the lookout. It also prevents low flying raptors from seeing the hawkwatchers until they are close. Best winds are NW and S, with higher numbers seen with NW winds, but closer views on the S winds.

Site History

During the 1930s a change began to emerge in perceptions about birds of prey. Instead of being only regarded as vermin to be exterminated, people began to study raptors with admiration. This trend first found noted voice at Hawk Mountain, with the efforts of Rosalie Edge beginning to shape new attitudes focused on stopping the ongoing slaughter of hawks. Places that had only seen shooting soon began to see quiet, peaceful observations of the autumn migration replace the carnage. Lesser known ridge lookouts were scouted and became known in the birding community. Most sites were in eastern Pennsylvania, with Bake Oven Knob being the most notable. By the late 30s two locations west of the Susquehanna River began to attract regular visitors. They were Sterrett's Gap and Waggoner's Gap. Reverend E. S. Frey compiled a book of counts made at Sterrett's Gap. Ted Hake from York County was one of the pioneers at Waggoner's Gap. He visited from the late 30s into the 90s, but left no recorded counts. The first known counts were made starting in 1948 by Lou Knohr, a high school science teacher at Carlisle High School. Unfortunately, the counts from 48-51 were lost. The first counts extant from 1952 to 1953 were in a summary format by species and obtained from Dr. Bertram Henry. The first daily counts from Waggoner's Gap were made by Lou Knohr and presented to Dr. C. J. Ralph of Dickinson College. These counts spanned the years 1954-1973 and only listed those raptors seen by Mr. Knohr and his wife Elsie on their frequent visits. A few other counts were recorded during this time and preserved by Dr. Ralph in the archives of the College. By the early 1970s interest in monitoring raptor migration resulted in a count in 1973 sponsored by the Appalachian Audubon Chapter of the National Audubon Society and led by Michael Kotz, a high school student from Harrisburg. This effort of 795 hours has been lost. The year 1974 saw the founding of the Hawk Migration Association of North America. Waggoner's Gap was represented by Dr. Ralph and Malcom Simons Jr. Plans were made to submit the Waggoner's Gap counts to HMANA using the HMANA forms. Rich Peiffer, a Cumberland Valley High School teacher, was chosen to be compiler. Peiffer, with help from Jake Baum and others, held the job until 1981 when he died from a

cancer. Greg Smith, from York, PA then took on the job until 1988, when the job was passed to Kim Van Fleet. She and her husband Glen served until 1994, when Dave Grove became compiler. Hours of observation increased throughout the period and it is now routine for over 1,000 hours of counting to be recorded in a season. The count protocol was oral history until 1998 when a written protocol was adopted by the counters. The land at the site was privately owned until 1953, when the site was purchased by the Reineman Wildlife Sanctuary Trust. In 2001, 20 acres of land encompassing the hawk watch was deeded to Pennsylvania Audubon for the purpose of preserving the site as a hawk watch. That fall a parking lot was built on the north side of the ridge and trails were built from the lot to the hawk watch.

Site Topography

A mountaintop watchsite with a 270 degree view of the SE on Kittatinny Ridge, the SE-most ridge in the C Appalachian Mountains. Counts are made from an exposed boulder field.

Directions to Site

From the east: On I-81 S take the Middlesex exit (exit 52) and turn right on Rt. 11S toward Carlisle. Go through the truckstops to the Carlisle turnpike exchange where we pick up all Pa Turnpike travelers. Continue south on Rt. 11 for 1.5 miles to a traffic light at Wolf Bridge Rd. Turn right. Follow Wolf Bridge Rd 2.5 miles to a stop sign at PA Rt. 34. Turn right and go .4 miles to a left turn on PA Rt. 944 W. Go 5 miles to a stop sign at the intersection with Pa Rt. 74. Turn right and go 2 miles up the mountain, being careful on the 90 degree turns. The parking lot is 200 yards beyond the crest on the right. Sign - Waggoner's Gap 1,476 feet

From Baltimore: Travel north on I83. Either take the Pa Turnpike west from Exit 18 or turn off I-83 onto I 581 W to I 81 S a mile beyond the Turnpike. Then follow the above.

From D.C.: Take Rt. 15N past Gettysburg to Pa Rt. 74N at Dillsburg. Follow Rt. 74 N through Carlisle to the mountain.

From Winchester, VA: Take I 81N to exit 47A in Carlisle. Turn left on Pa Rt. 34N. Go to the square in Carlisle and turn left onto Pa Rt. 74 N. Follow 74 N to the parking lot (Be careful following signs, there are two turns that can be tricky)

The Waggoner's Gap Hawk Watch can be reached by walking up a rock trail from the parking lot on the north side of the Kittatinny Ridge. The parking lot is off PA Route 74, about 6 miles NW of Carlisle, Pa.
